Pairs of numbers in "+" rows represent performance improvement over
 # compiler generated position-independent code, PIC, and non-PIC
 # respectively. PIC results are of greater relevance, as this module
 # is position-independent, i.e. suitable for a shared library or PIE.
 # Position independence "costs" one register, which is why compilers
 # are so close with non-PIC results, they have an extra register to
 # spare. CBC results are better than ECB ones thanks to "zero-copy"
 # private _x86_* interface, and are ~30-40% better than with compiler
 # generated cml1_cbc.o, and reach ~80-90% of x86_64 performance on
 # same CPU (where applicable).
